

Math1231 Lecture 12

He Wang

Northeastern University

October 5, 2015

1. Future value

1. Simple Interest

- Let P be the present value. (\$1000 for example)
- let r be the annual interest rate. (0.04 for example)
- The **accumulated interest** after t years is calculated as

$$I(t) = Prt \text{ dollars.}$$

- The **future value** at time t is

$$F_s(t) = P + Prt = P(1 + rt) \text{ dollars.}$$

2. Compound Interest

- Let P be the present value,
- let r be the annual percentage rate (APR).

The **future value** at time t in years of an investment (or loan) is

$$F_c(t) = P \cdot \left(1 + \frac{r}{n}\right)^{nt} \text{ dollars.}$$

where n is the number of compoundings per year.

- Compounded annually. $n = 1$.
- Compounded quarterly. $n = 4$.
- Compounded monthly. $n = 12$.
- Compounded semi-annually. $n = 2$.
- Compounded daily. $n = 365$.

3. Continuously compound Interest

The **future value** at time t in years of an investment

$$F_e(t) = P \cdot e^{rt} \text{ dollars.}$$

Example1(a). Write models for the future value of \$1000 at 4% APR, for simple interest, compound annually, compound monthly, compound daily, compound continuously.

- $Y1 = F_s(x) = 1000(1 + 0.04x)$

- $Y2 = 1000\left(1 + \frac{0.04}{1}\right)^x$

- $Y3 = 1000\left(1 + \frac{0.04}{12}\right)^{12x}$

- $Y4 = 1000\left(1 + \frac{0.04}{365}\right)^{365x}$

- $Y5 = F_e(x) = 1000e^{0.04x}$

Put the above functions to the calculator. Press [Y=], Enter functions, then using [TABLE].

Plot1	Plot2	Plot3	X	Y1	Y2
$\sqrt{Y_1} = 1000(1+0.04)^x$			1	1040	1040
$\sqrt{Y_2} = 1000(1+0.04)^x$			2	1080	1081.6
$\sqrt{Y_3} = 1000(1+0.04)^x$			3	1120	1124.9
$\sqrt{Y_4} = 1000(1+0.04)^x$			4	1160	1169.9
$\sqrt{Y_5} = 1000e^{(0.04x)}$			5	1200	1216.7
			6	1240	1265.3
			7	1280	1315.9
			$Y_1 = 1040$		

X	Y2	Y3	X	Y4	Y5
1	1040	1040.7	1	1040.8	1040.8
2	1081.6	1083.1	2	1083.3	1083.3
3	1124.9	1127.3	3	1127.5	1127.5
4	1169.9	1173.2	4	1173.5	1173.5
5	1216.7	1221	5	1221.4	1221.4
6	1265.3	1270.7	6	1271.2	1271.2
7	1315.9	1322.5	7	1323.1	1323.1
$Y_2 = 1040$			$Y_5 = 1040.81077419$		

Summarize the table data above: (future value of \$1000 at 4% APR)

Year	Value(F_s)	F_c (n=1)	F_c (n = 12)	F_c (n = 365)	Value(F_e)
0	\$1000	\$1000	\$1000	\$1000	\$1000
1	\$1040	\$1040	\$1040.7	\$1040.80	\$1040.81
2	\$1080	\$1081.6	\$1083.1	\$1083.28	\$1083.29
3	\$1120	\$1124.9	\$1127.3	\$1127.49	\$1127.50
4	\$1160	\$1169.9	\$1173.2	\$1173.50	\$1173.51
5	\$1200	\$1216.7	\$1121.0	\$1221.39	\$1121.40

Example (b).

Write the **rate of change** equation for Each future value.

$$\bullet Y1 = F_s(x) = 1000(1 + 0.04x) \quad \bullet F'_s(x) = 1000(0.04) = 40$$

$$\bullet Y2 = 1000\left(1 + \frac{0.04}{1}\right)^x$$

$$\bullet (Y2)' = 1000\left(1 + \frac{0.04}{1}\right)^x \ln(1.04)$$

$$\bullet Y3 = 1000\left(1 + \frac{0.04}{12}\right)^{12x}$$

$$\bullet (Y3)' = 1000\left(1 + \frac{0.04}{12}\right)^{12x} \ln\left(1 + \frac{0.04}{12}\right) 12$$

$$\bullet Y4 = 1000\left(1 + \frac{0.04}{365}\right)^{365x}$$

$$\bullet (Y4)' = 1000\left(1 + \frac{0.04}{365}\right)^{365x} \ln\left(1 + \frac{0.04}{365}\right) 365$$

$$\bullet Y5 = F_e(x) = 1000e^{0.04x} \quad \bullet F'_e(x) = 40e^{0.04x}$$

Example1 (c). How **quickly(rapidly)** is the investment $F_e(x)$ growing after 5 years.

Method1: Put $F'_e(x) = 40e^{0.04x}$ in the Calculator Y6. Then calculate $Y6(5)=48.856$ \$ per year.

Method2: Go back to home screen. Using [MATH], 8:[nDeriv(]

$$\left. \frac{d}{dX}(Y5) \right|_{X=5} = 48.856 \text{ \$ per year.}$$

TI-84 Plus calculator screen showing the definition of Y5 and Y6. The screen displays:

```
Plot1 Plot2 Plot3
Y3=1000(1+0.04)^
Y4=1000(1+0.04)^
Y5=1000e^(0.04X)
-----
Y6=40e^(0.04X)
```

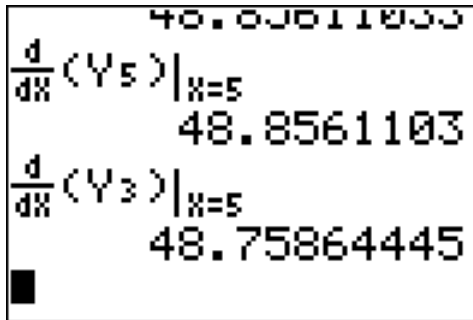

TI-84 Plus calculator screen showing the calculation of Y6(5) and its derivative. The screen displays:

```
Y6(5)
48.85611033
d/dX(Y5)|X=5
48.8561103
```

Example1 (d). How **quickly(rapidly)** is the investment Y_3 growing after 5 years.

Using [MATH], 8:[nDeriv(]

$$\left. \frac{d}{dX}(Y_3) \right|_{X=5} = 48.759 \text{ \$ per year.}$$

A calculator screen showing two derivative calculations. The first calculation is for $\frac{d}{dX}(Y_5)$ at $X=5$, resulting in 48.8561103. The second calculation is for $\frac{d}{dX}(Y_3)$ at $X=5$, resulting in 48.75864445. A small black square is visible in the bottom left corner of the screen.

```
40.00011033  
 $\frac{d}{dX}(Y_5)$  |  $X=5$   
48.8561103  
 $\frac{d}{dX}(Y_3)$  |  $X=5$   
48.75864445  
■
```

Example. The number of phones in a country for the years 1990 through 2020 can be modeled by

$$N(x) = 1.1x^3 + 0.3x^2 + 0.2x + 5.11 \quad \text{million phones,}$$

where x is the number of years after 1990.

(a). Write out the rate-of-change formula for the number of phones in the country.

$$N'(x) = 3.3x^2 + 0.6x + 0.2 \quad \text{million phone per year}$$

(b). Fill in the following table.

	1991	2000	2010	Units
x				
number of phones				
Rate of change of $N(x)$				

Example. The number of phones in a country for the years 1990 through 2020 can be modeled by

$$N(x) = 1.1x^3 + 0.3x^2 + 0.2x + 5.11 \quad \text{million phones,}$$

where x is the number of years after 1990.

(a). Write out the rate-of-change formula for the number of phones in the country.

$$N'(x) = 3.3x^2 + 0.6x + 0.2 \quad \text{million phone per year}$$

(b). Fill in the following table.

	1991	2000	2010	Units
x	1	10	20	year
number of phones				
Rate of change of $N(x)$				

Enter $N(x)$ to Y1, Enter $N'(x)$ to Y2. Check the [TABLE]

	1991	2000	2010	Units
x	1	10	20	year
number of phones	6.71	1137.11	8929.11	million
Rate of change of $N(x)$	4.1	336.2	1332.2	million per year

Another method find the rate of change using [nDeriv()] Enter

$$\frac{d}{dX}(Y1) \Big|_{X=X} \text{ to Y3}$$

Y1(1)	6.71	Y2(1)	4.1	Y3(1)	4.1000011
Y1(10)	1137.11	Y2(10)	336.2	Y3(10)	336.2000011
Y1(20)	8929.11	Y2(20)	1332.2	Y3(20)	1332.200001
